

Skyline Vault Signals on Prop-Firm Challenges

How the Skyline Gold Vault and Skyline Orbit signals would have performed under the published rules of eleven futures prop-firm programmes — a simulation on recorded market data, 10 September to 09 October 2026.

\$14,980 Gold signal - net result, \$50,000 account, after costs	\$6,461 Bitcoin signal - net result, \$50,000 account, after costs	10 / 10 Gold: evaluations passed (first attempt, every programme)	5 days Gold: fastest pass (trading days)
0 Funded accounts lost (both signals, all firms)	82% Gold: profitable trading days (18 of 22)	-\$1,036 Gold: largest peak-to-trough drawdown	2.54 Gold: profit factor (gross wins / gross losses)

Hypothetical performance. The results in this report are simulated. They come from replaying the signals' fixed rules on recorded market data for 10 September - 09 October 2026 and applying each firm's published evaluation and payout rules. No real account traded these results and no subscriber is reported to have earned them. Hypothetical results have inherent limitations: they are prepared with the benefit of hindsight, do not involve financial risk, and cannot fully account for slippage, liquidity, platform outages or the discipline needed to follow every signal. No representation is made that any account will or is likely to achieve similar results. Past performance, simulated or actual, is not indicative of future results. Not investment advice.

Contents

1. The two signals at a glance 2. Firm-by-firm results - Gold 3. Firm-by-firm results - Bitcoin 4. What a subscriber's month could have looked like

1. The two signals at a glance

Skyline Vault Signals are fully rule-based. Each signal is generated from live order-flow data on our servers, with a fixed entry, a fixed protective stop and a pre-defined exit plan. Position size is set so that a full loss costs about \$250 including commission - 1/8 of a typical \$2,000 evaluation drawdown - and every position is closed before the futures session ends. No discretion was applied in the simulation.

	Skyline Gold Vault - Gold (CME micro gold, MGC)	Skyline Orbit - Bitcoin (CME micro bitcoin, MBT)
Trades	121	58
Net result on \$50,000 (commission and slippage included)	\$14,980	\$6,461
Win rate	45%	50%
Profit factor	2.54	1.87
Average result per trade (in units of risk)	+0.85R	+0.45R
Profitable trading days	18 of 22	13 of 21
Best day / worst day	\$1,475 / -\$559	\$1,614 / -\$764
Largest peak-to-trough drawdown	-\$1,036	-\$1,003
Trade limit	2 entries per session (Asia, London, New York)	3 entries per day

Account balance of a \$50,000 account taking every signal, 10 Sep - 09 Oct 2026 (hypothetical).

2. Firm-by-firm results - Skyline Gold Vault (Gold)

Each programme's evaluation and payout rules were applied to the same gold signal: one account per firm, started on 10 September, with payouts requested on the first day the rules allowed. A failed account would have been restarted; none was needed.

Firm and plan (rules as published, Oct 2026)	Evaluation	Trading days to pass	Payouts	Paid to trader
MyFundedFutures - Pro \$3,000 target, \$2,000 EOD drawdown, 50% consistency in evaluation; payouts every 14 days, 80% split	PASSED 16 Sep	5	1	\$4,036
Apex Trader Funding - EOD \$3,000 target, \$2,000 EOD drawdown; 5 qualifying days, 50% consistency and capped amounts per payout	PASSED 16 Sep	5	2	\$3,000
Topstep - Express Funded \$3,000 target, \$2,000 max loss, 55% consistency; 5 winning days per payout, up to 50% of balance	PASSED 16 Sep	5	2	\$3,600
Tradeify - Growth \$3,000 target, \$2,000 EOD drawdown; 35% funded consistency, 5 winning days per payout	PASSED 16 Sep	5	2	\$3,600
Lucid Trading - Direct No evaluation (direct funding); 20% consistency - one of the strictest rules in the industry	No evaluation	-	2	\$3,600
Alpha Futures - Zero \$3,000 target, daily loss guard; 40% funded consistency, 5 winning days, up to 4 payouts a month	PASSED 16 Sep	5	2	\$4,831
Elite Trader Funding 8 qualifying days before the first payout (10 after), each at least \$200; 40% consistency	PASSED 16 Sep	5	1	\$1,800
Bulenox - Master 10 trading days and a 40% best-day rule per payout; weekly payouts, capped at \$1,500 for the first three	PASSED 16 Sep	5	1	\$1,500
Lucid Trading - Daily \$3,000 target; daily payout requests with a \$2,100 buffer, no funded consistency	PASSED 16 Sep	5	9	\$8,511
Tradeify - Select 50K \$3,000 target, \$2,000 EOD drawdown, 40% consistency, 3 days minimum; Flex payouts every 5 winning days	PASSED 17 Sep	6	2	\$4,231
Tradeify - Select 150K \$9,000 target, \$4,500 EOD drawdown, 40% consistency, 3 days minimum; Flex payouts up to \$4,500	PASSED 17 Sep	6	2	\$8,100

What stands out. The gold signal passed every evaluation at the first attempt, the fastest in five trading days, and no funded account was lost. Programmes that pay daily or with fewer qualifying days (Lucid Daily, Tradeify Select 150K, MyFundedFutures Pro) returned the most within the month. Even Lucid Direct's 20% consistency rule - among the hardest in the industry - allowed two payouts.

3. Firm-by-firm results - Skyline Orbit (Bitcoin)

The bitcoin signal trades less often and produced a smaller, steadier result. It passed every evaluation within eight to twelve trading days. Because the evaluations finished in the second half of the window, most funded accounts had not yet completed a payout cycle by 09 October; their profits stayed in the funded balance and are not counted below.

Firm and plan (rules as published, Oct 2026)	Evaluation	Trading days to pass	Payouts	Paid to trader
MyFundedFutures - Pro \$3,000 target, \$2,000 EOD drawdown, 50% consistency in evaluation; payouts every 14 days, 80% split	PASSED 21 Sep	8	0	\$0
Apex Trader Funding - EOD \$3,000 target, \$2,000 EOD drawdown; 5 qualifying days, 50% consistency and capped amounts per payout	PASSED 21 Sep	8	1	\$844
Topstep - Express Funded \$3,000 target, \$2,000 max loss, 55% consistency; 5 winning days per payout, up to 50% of balance	PASSED 21 Sep	8	1	\$593
Tradeify - Growth \$3,000 target, \$2,000 EOD drawdown; 35% funded consistency, 5 winning days per payout	PASSED 21 Sep	8	0	\$0
Lucid Trading - Direct No evaluation (direct funding); 20% consistency - one of the strictest rules in the industry	No evaluation	-	0	\$0
Alpha Futures - Zero \$3,000 target, daily loss guard; 40% funded consistency, 5 winning days, up to 4 payouts a month	PASSED 21 Sep	8	0	\$0
Elite Trader Funding 8 qualifying days before the first payout (10 after), each at least \$200; 40% consistency	PASSED 21 Sep	8	0	\$0
Bulenox - Master 10 trading days and a 40% best-day rule per payout; weekly payouts, capped at \$1,500 for the first three	PASSED 21 Sep	8	0	\$0
Lucid Trading - Daily \$3,000 target; daily payout requests with a \$2,100 buffer, no funded consistency	PASSED 21 Sep	8	1	\$523
Tradeify - Select 50K \$3,000 target, \$2,000 EOD drawdown, 40% consistency, 3 days minimum; Flex payouts every 5 winning days	PASSED 25 Sep	12	1	\$1,160
Tradeify - Select 150K \$9,000 target, \$4,500 EOD drawdown, 40% consistency, 3 days minimum; Flex payouts up to \$4,500	PASSED 25 Sep	12	1	\$2,610

What stands out. No evaluation failed and no funded account was lost. Payouts within the month came from programmes with short payout cycles (Tradeify Select, Apex, Topstep, Lucid Daily). Over a longer period the bitcoin signal is best used as a second, independent account next to gold.

4. What a subscriber's month could have looked like

Three illustrations built from the tables above. Evaluation fees use the list prices published by Tradeify on 1 September 2026; promotional codes often reduce them. The Skyline subscription fee is not included.

Scenario (10 Sep - 09 Oct 2026, hypothetical)	Evaluation fees	Payouts to the trader	Net after fees
A. Two Tradeify Select 50K accounts - one follows the Gold signal, one the Bitcoin signal	\$330	\$5,391	\$5,061
B. One Tradeify Select 150K account following the Gold signal	\$369	\$8,100	\$7,731
C. One Lucid Daily account following the Gold signal (daily payouts)	see firm	\$8,511	before fees

Payouts to the trader by programme, both signals (hypothetical).

How the simulation trades each signal

Step	What happens
1. Signal	A signal candle closes (shown on the platform chart with a D mark on both Gold and Bitcoin).
2. Entry	Entry, stop and first target follow fixed rules; position size follows the account size.
3. Management	Half the position is taken off at three times the risk and the stop moves to entry; the rest follows the signal's exit plan.
4. Rule guard	Daily and session trade limits, a news blackout around major US releases, and the session-end flat time keep the account inside prop-firm rules.

Hypothetical performance. The results in this report are simulated. They come from replaying the signals' fixed rules on recorded market data for 10 September - 09 October 2026 and applying each firm's published evaluation and payout rules. No real account traded these results and no subscriber is reported to have earned them. Hypothetical results have inherent limitations: they are prepared with the benefit of hindsight, do not involve financial risk, and cannot fully account for slippage, liquidity, platform outages or the discipline needed to follow every signal. No representation is made that any account will or is likely to achieve similar results. Past performance, simulated or actual, is not indicative of future results. Not investment advice.

Firm names are used only to identify the published rule sets that were modelled; the firms are not affiliated with Skyline Trading Systems and do not endorse this report. Futures trading involves substantial risk of loss.
